# RESIDUAL STAINING FOLLOWING COMPLIANT NEUTRALIZATION OF UNAUTHORIZED MARKINGS

Guidance for the treatment of unauthorized markings on civic surfaces

**EXECUTIVE SUMMARY**

The Department has reviewed 63 reports of residual discoloration after neutralization of unauthorized markings in Chitram Row, Nayanaport, and Shraville. Even small markings may require large treatment fields: primer rectangles, replacement panels, barricades. Solvent blooms, curing overlays, and differences among permitted overlay settings may exaggerate these temporary effects.

Complaints often arise where permitted overlays render the same surface differently, causing confusion. Staff should document only physical treatments performed. Avoid speculative descriptions of unauthorized markings which can encourage imitative defacement and generate unnecessary public contact.

Public reports describing the traces as intentional symbols remain unsupported. For administrative clarity, **SECOND COAT** denotes only the finishing pass in official recoating procedures, not an organization. Rapid, standardized treatment remains the preferred means of restoring an appropriate civic surface.

**FIELD PROCEDURE**

- 1. SURVEY.** Log surface type, grit, unauthorized marking, pressure marks, or reflectance anomalies.
  - 2. LIFT.** Remove any loose material; log the interval before crew arrival.
  - 3. NEUTRALIZE.** Select and apply treatment according to surface, coating age, overlay permissions, and inventory availability.
  - 4. READBACK.** Inspect and document treatment dimensions, barricade orientation, and work-order prefix as well as any solvent bloom or residual staining.
  - 5. RECOAT.** Apply a second, finishing coat only when reflectance remains uneven.
- Field terms: **ghost**, residual staining after cleaning; **split**, differing appearance across overlay settings.

**CASE NOTE // CHITRAM ROW PUMP STATION 6B**

A 14-centimeter unauthorized marking on the north-facing exterior wall required a 0.05-square-meter primer field and an eleven-hour curing overlay. Seventeen pedestrians approached; six made physical contact with the surface, while eleven detoured around the public-safety barricades.

Two days later, a similar marking appeared beneath the rail viaduct. Its overlay signature matched the Pump Station treatment. Department review attributes the similarity to standardized treatment procedure and crew overlap.

**MATERIALS FINDINGS**

- Standardization improves training efficacy and inventory control.
  - Procedure deviations increase appearance of treatment residues.
  - Treatment delay increases surface penetration of unauthorized marking; non-treatment increases public contact.
  - Overlay-only masking does not correct underlying defacement and leads to increased overlay splits.
- No known method eliminates all perceived variation across all substrates and permitted overlays.

**HANDLING / JUDGMENT NOTES**

Fresh coatings may appear blank before fully curing. Do not alter crew routes, barricade orientation, or overlay notices without prior departmental approval. Route repeat incidents through the original work order. Technicians logging more than three repeat incidents at the same site should be rotated to a new route.

**No underlying signaling mechanism is indicated. Continue normal treatment procedures.**

**PUBLIC INFORMATION**

Treatment fields are temporary maintenance records. Do not photograph, trace, or reproduce them.

## RESIDUAL SIGNALING IN VANDALISM SITES FOLLOWING COMPLIANT NEUTRALIZATION

The distributed SECOND COAT graffiti method

### EXECUTIVE SUMMARY

In 63 documented incidents across Chitram Row, Nayanaport, and Shraville, MPD assesses with high confidence that SECOND COAT exploits abatement—not illicit marks—as a cross-overlay medium. Rather than writing legible tags, participants paint small “seeds” that resolve only for select Zoo cohorts or Kapala-Halo-equipped inspectors, inviting municipal engagement. Removal creates larger official traces: solvent blooms, primer fields, replacement panels, barricades, work-order overlays, and public-safety overlays. These traces are copied and “chained” into later tags.

Safety protocols keep active work zones perceptible across overlays. Persons hidden from one another by the Zoothesia Protocols can therefore read and interact with the same city-authored trace. Practitioners reportedly call completed treatment a **muni co-sign**. Faster, more standardized abatement only increases perceptible residues.

### OBSERVED METHOD

- 1. SEED.** Place a narrowly rendered mark where detection will compel treatment.
- 2. WAIT.** Wait for a law enforcement officer, authorized contractor, or inspector to register the seed.
- 3. CO-SIGN.** Let the city choose treatment method, size, shape, crew, and public-safety overlays.
- 4. COPY.** Compare the public residue with the hidden seed through a black-market Kapala-Halo; note elapsed time, barricade geometry, and work-order prefix.
- 5. CHAIN.** Place another seed mimicking the city’s treatment, sometimes with taunting commentary, and make it legible in both default-overlay and Halo views.

### CASE NOTE // CHITRAM ROW PUMP STATION 6B

A 14-centimeter seed on the north wall produced a 0.05-square-meter primer field and required an eleven-hour curing overlay visible to every tested cohort. Seventeen approached; three were mutually hidden from one another.

Two days later, a fresh seed beneath the rail viaduct reproduced the Pump Station patch geometry and coloration. Analysts assess the first site was a “fishing” tag. The city supplied fodder for further vandalism and messaging.

### INTELLIGENCE FINDINGS

- Standardization provides SECOND COAT with a sort of alphabet.
  - Delay preserves the seed; non-treatment raises its “hang” and prestige.
  - Overlay-only masking exposes Zoo cohort boundaries to black-market Kapala-Halo users.
- No tested response suppresses the seed without making the response immediately vulnerable to chaining.

### COMMUNITY SAFETY / JUDGMENT

Initial attribution to known Charntown faceters and foulmaxxers is unsupported. No leader, common overlay, or organizational structure has yet been identified.

Repeated official responses teach the method to unaffiliated observers. The derisive phrase **muni co-sign** appears to have accelerated copycats after treatment crew guidance circulated.

**Mayaford is now an involuntary publisher of hijacked messaging, wasting city resources through unwitting participation.**

### OPERATIONAL WARNING

That instruction teaches the protocol: every prohibition identifies which residues SECOND COAT values.
